

Title: RePut Overview & Platform Capabilities

Section 1 – Who We Are

RePut is a SaaS platform that acts as a single source of truth for supply chains. It connects data from suppliers, product origins, certifications, and regulations into one verifiable environment. The goal is to give brands end-to-end visibility so that claims about sourcing, sustainability, and compliance can actually be checked, not just written in a slide.

The platform is built for global brands and works across geographies. It is used in multiple countries and sectors, helping companies reduce blind spots in complex value chains, from raw material extraction to finished product on the shelf.

Section 2 – Why RePut Exists

Modern supply chains are complicated: data is fragmented, environmental impacts are often invisible, and sustainability claims are hard to validate. RePut's core belief is that transparency is a foundation for credibility. If companies want to prove responsible sourcing, lower emissions, and circular use of materials, they need traceable data that can be trusted.

RePut was built to close these gaps with:

- Verifiable data rather than only self-reported claims
- Real-time visibility instead of static, annual reporting
- Tools that convert sustainability work into customer and investor trust

Section 3 – Core Product Modules

RePut is organised around a unified, blockchain-enabled platform with several flagship modules:

1. RePut Tracechain™

- Focus: traceability and supply chain mapping
- Function: links every step from raw material to finished product, creating a traceable chain of custody.
- Outcome: brands can show exactly where inputs come from, who handled them, and how they move through the network.

2. RePut Zero Carbon™

- Focus: emissions tracking and decarbonisation
- Function: collects and manages carbon data across the value chain with auditable records, enabling calculations aligned with global standards.
- Outcome: companies can measure, monitor, and report emissions, and use that information to design reduction strategies.

3. RePut Circle™

- Focus: circularity and recovery
- Function: connects brands with recycler networks, tracks recovery and recycling flows, and generates digital proof of circular outcomes.
- Outcome: organisations can build circular systems and show evidence of material recovery and reuse.

Section 4 – Features & Technology

RePut combines several capabilities into one platform:

- **Supply chain mapping & nth-tier traceability:** not just Tier 1 suppliers, but deeper layers in the network.
- **Magic Scan & bulk upload:** tools to digitise and ingest documents and certificates at scale.
- **ERP integrations:** connects with existing business systems so data does not sit in silos.
- **AI-driven insights:** anomaly detection, risk mapping, prescriptive analytics, compliance assurance, and supply chain resilience tools, all powered by advanced analytics.
- **Blockchain backbone:** uses distributed ledger principles to make records tamper-resistant and verifiable.

Section 5 – Industries Served

RePut is designed for high-impact, highly regulated industries where traceability and sustainability are critical. Examples include:

- Textile and fashion
- Food and beverage
- Personal care and cosmetics
- Jewellery
- Pharmaceuticals

The platform supports “soil to shelf” and “mine to market” journeys, helping brands in these sectors connect ESG data directly to the physical products customers buy.

Section 6 – Regulatory & Compliance Focus

RePut helps companies navigate multiple regulations and frameworks by aligning data and reporting with:

- India: Companies Act 2013 ESG / CSR requirements, BRSR (Business Responsibility and Sustainability Reporting)
- Europe: emerging supply chain due diligence and EU taxonomy-related rules
- USA: supplier-related regulations and responsible sourcing requirements

The goal is to move from “reactive compliance” to proactive readiness, where companies can demonstrate that their supply chains are aligned with global sustainability expectations.

Section 7 – Impact Stories & Use Cases

RePut’s platform has been used by brands to

- Build **Digital Product Passports (DPPs)** for apparel, tracing garments from farm to wardrobe and linking ESG metrics and certifications to each product.
- Provide full visibility for a European denim brand’s Indian supply chain, supporting compliance and customer-facing transparency.
- Measure and manage carbon data for a steel fabricator, enabling low-emission steel strategies and keeping them competitive in global markets.

These stories show how traceable data can become both a compliance backbone and a market differentiator.

Section 8 – Customer Validation & Trust

RePut lists multiple recognised brands as users and highlights testimonials around:

- Greater transparency and mapping of supplier networks
- Increased consumer trust
- Better inventory and product insights

Overall, the platform positions itself as a secure, enterprise-grade system for sustainability-driven supply chain transformation.
